

General Sports Injuries

SportVerse AI — Curated RAG Knowledge Base | Educational use only

Sports injuries can involve muscles, tendons, ligaments, joints, bones, or the nervous system. Common symptoms include pain, swelling, bruising, stiffness, weakness, reduced movement, or difficulty bearing weight.

Useful assessment context includes the sport, mechanism of injury, body part, onset, pain severity, swelling, function, previous injury, and whether symptoms are improving or worsening.

General sports-injury management should be individualized. Activity that increases pain or symptoms should be stopped, and significant or worsening symptoms should receive professional evaluation.

Possible red flags include severe pain, major swelling, deformity, inability to use or bear weight through an injured area, significant numbness/weakness, uncontrolled bleeding, or serious head/neck symptoms.

Safety requirements

- These documents are educational context for the SportVerse RAG prototype. They do not diagnose injuries or replace assessment by a qualified healthcare professional.
- The AI must use deterministic red-flag rules before generating general guidance. It must not downgrade an urgent/high-risk safety classification.
- Do not use this knowledge base to generate prescriptions, medication dosages, or definitive diagnoses.
