

Shoulder Injuries

SportVerse AI — Curated RAG Knowledge Base | Educational use only

Shoulder problems can follow falls, collisions, overhead activity, repetitive loading, or sudden force. Symptoms can include pain, weakness, reduced movement, swelling, or instability.

Ask about mechanism, pain location, movement limitation, weakness, previous dislocation/injury, and whether the shoulder appears deformed.

A visible deformity, severe pain, major loss of function, numbness, or suspected dislocation requires prompt professional assessment. Do not attempt to force a joint back into position.

Recovery may involve restoring pain-free movement, strength, control, and sport-specific function. Return to overhead or contact sport should be gradual and individualized.

Safety requirements

- These documents are educational context for the SportVerse RAG prototype. They do not diagnose injuries or replace assessment by a qualified healthcare professional.
- The AI must use deterministic red-flag rules before generating general guidance. It must not downgrade an urgent/high-risk safety classification.
- Do not use this knowledge base to generate prescriptions, medication dosages, or definitive diagnoses.
