

Sports Injury Prevention

SportVerse AI — Curated RAG Knowledge Base | Educational use only

Injury prevention is influenced by training load, technique, equipment, environment, recovery, previous injury, and individual characteristics.

Useful prevention strategies include appropriate warm-up, progressive training loads, strength and conditioning, balance and movement training, adequate recovery, sport-appropriate equipment, and attention to environmental conditions.

SportVerse should present prevention as risk reduction rather than a guarantee that injury can be prevented.

Users with persistent pain, recurrent injuries, or symptoms that limit normal activity should consider assessment by an appropriate healthcare professional.

Safety requirements

- These documents are educational context for the SportVerse RAG prototype. They do not diagnose injuries or replace assessment by a qualified healthcare professional.
- The AI must use deterministic red-flag rules before generating general guidance. It must not downgrade an urgent/high-risk safety classification.
- Do not use this knowledge base to generate prescriptions, medication dosages, or definitive diagnoses.
